GETTING THE BEST FRIDGE PERFORMANCE

TIPS FOR USE IN HOT WEATHER

Please read the troubleshooting notes in the instructions!

The fridge cools to 20oc lower than the air temperature in the van as per all camping fridges. This means in extreme heat, the fridge may not cool efficiently. Note that the ambient temperature inside the van may be hotter than the outside environment.

Always use on mains hook-up for the best performance, where there is the option. Gas is efficient but it will take longer to cool down. 12v will not cool!! It maintains whatever the temperature is in the time that you are driving *only*.

Going out for the day? Use the fridge on gas when you are parked up to keep the temperature cool. On a hot day, with no fridge power - the fridge will not keep the items cold as it's not as insulated as a fridge at home. (Don't forget to switch off gas when driving as this can cause carbon to blow in the contacts and the fridge will not work at all until it is serviced).

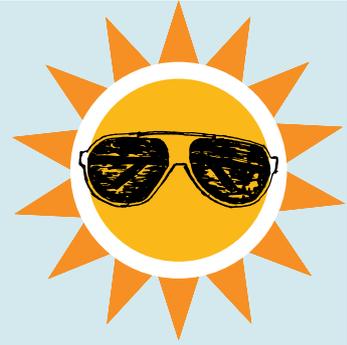

Be fridge 'aware' when opening the fridge on a hot day, the fridge's cool air will escape so be quick with getting things in and out. Please consider that adding new shopping will raise the temperature and will require further time to be cooled again

If hot weather is expected - it is best to shop light. A fully packed fridge will not allow the cold air to circulate at all and therefore not cool your items.

USING THESE TIPS WILL ENSURE YOU GET THE BEST PERFORMANCE FROM THE FRIDGE!!

When you touch the silver case at the back - double check is it cold???

YES - Please give the fridge a chance to cool

NO - Please read the trouble shooting page and follow these instructions

Please give the fridge a chance to cool
